and research

Problem Statement

- **Website Authentication:** Develop algorithms to assess the legitimacy of websites based on domain, SSL certificates, and other authentication indicators.
- **Ad Content Analysis:** Implement NLP and image recognition techniques to evaluate the authenticity and accuracy of ad content.
- **Customer Care Number Verification:** Establish a database of verified customer care numbers and compare incoming numbers to identify potential scams.
- **Real-time Detection:** Enable real-time analysis of online content to prevent users from accessing fake or malicious websites.
- **User Feedback Integration:** Incorporate mechanisms for user feedback to enhance the system's accuracy and adapt to evolving fraudulent tactics.

Proposed Solution

- Capturing malicious links,c2 servers,botners,phishing sites ,adware at the network layer before hitting the application layer.
- Display of live feed data along with transparency certificate.
- Custom trained Deep learning model to detect the spam ad,news and sock puppets.
- Use of multiple threat intelligence and OISNT tools to identify potential scammers.
- Reputation metrics of email,phone numbers,domain names and SMS to identify scam score.
- Multi-linguistic feature and user friendliness.
- Chat bot with voice recognition feature.
- Crossplatform- supports web,mobile,etc.
- Multi-varied OS Approach.

Our Product

FUTURE IMPLEMNTATION

- Grafana Dashboard and Monitoring service
- Zero-day vulnerabilities identifier
- Centralized Patch Management System
- Effective model generation for web-based attacks
